ABSTRACT

In the Implementation of any electrical power generation project, the basic requirement is the total electrical energy demand estimation. In order to estimate the total electrical energy demand, various methods can be used but neither of those methods can give the exact demand. Therefore approximate analysis of energy demand is always taken in to the consideration. In this study three villages are selected in Rajasthan state and electrical energy demand of those villages is estimated. For the estimation of energy demands two sources of data are taken in to consideration. i.e. survey data and bill data. Survey data is collected by a questionnaire based survey and bill data are taken from electricity Distribution Company for the three selected village. On the basis of these two data, energy consumption parameters such as Energy consumption of village in MWh/annum, Energy consumption of family in kWh/annum, Per capita Energy consumption in kWh/annum, Energy consumption of village in MWh/month, Energy consumption of family in kWh/month, Per capita Energy consumption in kWh/month and Average Power in kW/month are calculated for each village .these energy consumption parameters are calculated in both the cases i.e. by using survey data and by using bill data, and comparison has made in tabular manner as well as graphical manner in order to observe deviation between the parameters properly.

1. INTRODUCTION

Jhar, Mansarkheri and Khijooriya jatan are the three selected villages for the study which are located in

Bassi sub division of Jaipur district in Rajasthan (latitude $26^{\circ}83'N$, longitude $76^{\circ}05'E$, altitude 351 m).

Prasad et al. [1] showed an overview about the different facets of planning of energy with the help of various literatures. They showed the uncertainties, errors and risks which are involved in very well manner with the energy planning and continuously affecting the planning results. **Urmee et al. [2]** presented a study in which they showed the reasons of slow progress of renewable energy technologies based electrification. They suggested on the basis of literature reviewed on renewable energy based electrification that better coordination is very much required between the national level agencies and regional agencies which are actively involved in the development and the implementation of renewable energy based electrification program. **Kautto and Peck [3]** examined the potential of Biomass planning at regional level to support the Biomass planning at national level, European Union target achievement and addressing the concerns which are involved with increased bio energy production. **Singh [4]** presented a study which investigated the commercial availability of the biomass from the agricultural activities in Punjab in order to generate power from distributed power generation facilities. He estimated the total production of crop generated residues which is 55.396 Mt. Out of this total crop residue around 40.17% which is 22.315 Mt is found to be surplus which can be used as biomass in power plants for the generation of electricity

Bhandari and Jana [5] presented the impacts of characteristics of individual rural households on the priority of electrical energy from solar energy based system. This study is based upon the rural energy survey which is conducted in a coastal village of Indian sundarban. **Ishan and Pallav [6]** evaluated the solar power generation based on concentrating technology (CSP), technically as well as financially in India. They concluded that CSP based power generation facilities are financial feasible for selected part of India like north-western part especially Rajasthan and Gujarat states.

2. DATA COLLECTION AND COMPARISON

Energy consumption data of the villages Jhar, Mansarkheri and Khi.Jatan is collected by

questionnaire based survey. In each village 50 households are selected in equal proportion of lower income group, moderate income group and higher income group in order to maintain reliability of the study and for better analysis and data is collected. The population related data of villages is also collected from Census Authority of the Rajasthan in which the population of the three villages is mentioned and tabulated in **table-1**.

The data collected by the survey is the primary data of energy consumption of villages and approximate also therefore energy consumption data is also collected from electricity bills provided by the local electricity distribution company. The data collected by survey is tabulated in Table-2 and bill data are tabulated in table-3 to table-5. Sample calculation for Jhar Village is as follows-

Annual electricity consumption of 50 households = 51780 kWh. Therefore annual electricity consumption per family = $\frac{51780}{50} = 1035.60 \text{ kWh}$

Total number of families = 757

Therefore annual electricity consumption of whole village = $1035.60 \times 757 = 783949.20 \text{ kWh} = 783.95 \text{ MWh}$

Total population = 4683

Therefore annual per capita electricity consumption = $\frac{783.95}{4683} = 167.40 \text{ kWh}$

Some deviation is observed between collected data by the survey and collected data from electricity bills. To observe that deviation the consolidated data of electricity consumption both by electricity bills and survey are arranged in tabulated format in **Table-6**.

Table-6: Consolidated electricity consumption data of villages

Particulars	X Bill	X survey	Y Bill	Y Survey	Z Bill	Z Survey
A	863.16	783.95	584.60	557.12	163.04	155.63
B	1140.20	1035.60	1139.58	1086	823.42	786
C	184.32	167.40	159.64	152.13	172.89	165.03
D	71.93	65.33	48.72	46.43	13.59	12.97
E	95.02	86.30	94.97	90.50	68.62	65.50
F	15.36	13.95	13.30	12.68	14.41	13.75
G	337.83	306.83	228.81	218.06	63.81	60.91

A-Energy consumption of villages in MWh/annum, B-Energy consumption of family in kWh/annum, C- Per capita Energy consumption in kWh/annum, D- Energy consumption of villages in MWh/month, E-

Energy consumption of family in kWh/month, F- Per capita Energy consumption in kWh/month, G- Average Power in kW/month, X- Jhar, Y-Mansarkheri and Z-Khijooriya jatan

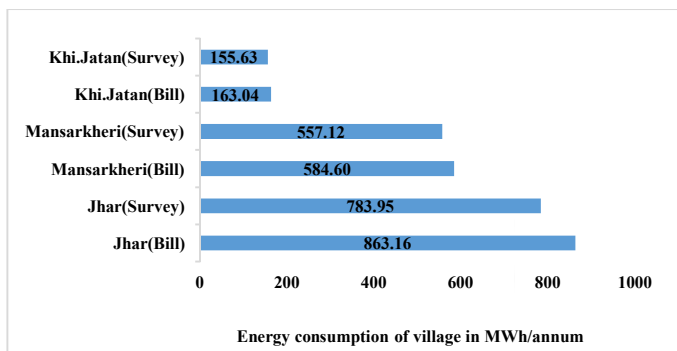

Figure -1: Energy consumption of village in MWh/annum

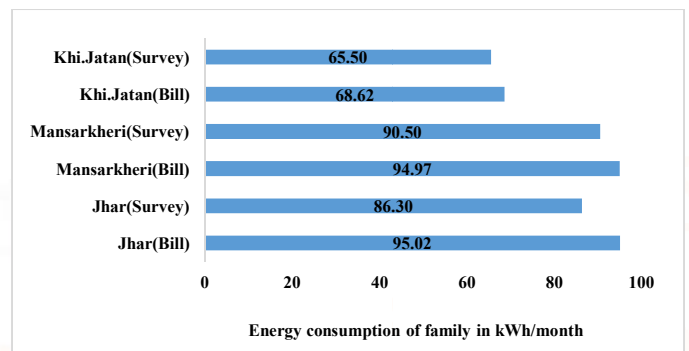

Figure -5 Energy consumption of family in kWh/month

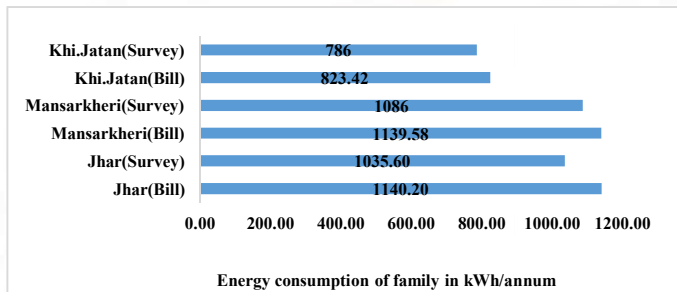

Figure-2: Energy consumption of family in kWh/annum

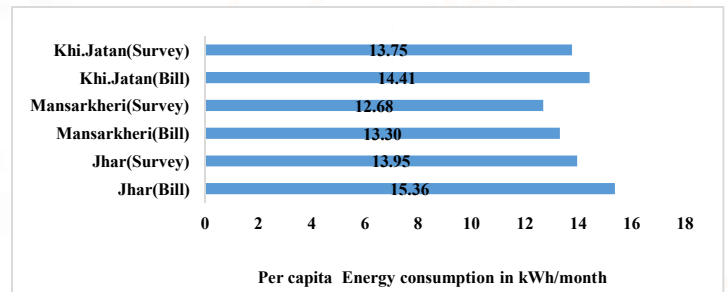

Figure-6: Per capita energy consumption in kWh/month

Figure-3: Per capita energy consumption in kWh/annum

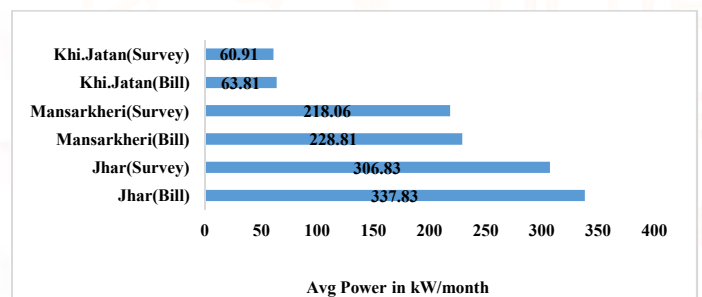

Figure-7: Average power requirement in kW/month

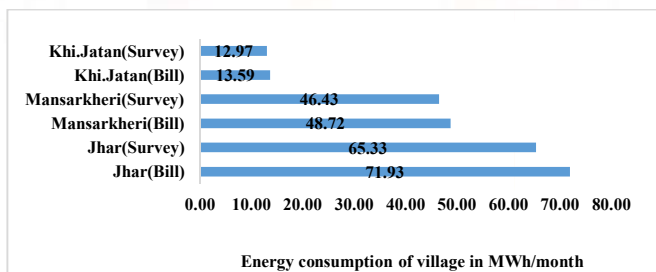

Figure-4: Energy consumption of village in MWh/month

The plots between survey data and bill data have also been plotted for each energy consumption parameters and shown in figures-1 to figure-7.

3. CONCLUSIONS

In this study electricity consumption data is collected by survey as well as local electricity Distribution Company. On the basis of these data, energy consumption parameters i.e. A-Energy consumption of villages in MWh/annum, B-Energy consumption of family in kWh/annum, C-Per capita Energy consumption in kWh/annum, D-Energy consumption of villages in MWh/month, E- Energy consumption of family in kWh/month, F- Per capita Energy consumption in kWh/month, G-Average Power in kW/month, have been calculated. Graphical representations also have been plotted between survey data and bill data for the purpose of comparative view. By viewing the graphical plots of energy consumption parameters it can be concluded that

Energy consumption parameters A, B, C, D, E, F, G calculated by survey data are found to be less for each village as compared to energy consumption parameters calculated by bill data. Bill data therefore should be taken as reference data for designing any electrical power generation facility for the villages, instead of survey data because bill data are based on the meter readings of the individual households which shows the actual electricity consumed by the household.
