Department of Agricultural Extension, College of Agriculture, Prof. Jayashankar Telangana State Agricultural University, Rajendranagar, HYDERABAD (TELANGANA) INDIA (Email : archana.palle@gmail.com; illuris@gmail.com)

**Abstract :** The paper describes the level of knowledge of watershed farmers on various NRM practices in watershed areas of Andhra Pradesh state. The results indicated that majority of the watershed farmers fell under the category of medium (36.25%) level of knowledge followed by low (33.33%) and high (30.42%) level of knowledge. Further the rank wise analysis of level of knowledge of watershed farmers on various NRM practices infers that the usage of check dams to harvest the water has been perceived as first rank followed by usage of percolation tank for increasing the groundwater (II rank) and the least preferred knowledge items were NRM is possible only by the community participation (XIX rank), the grass which is highly recommended as vegetative barrier (XIX rank), the plants which are highly recommended for live fencing (XVIII rank) and gully formation can be checked by either building check dams or increasing width of gully, leaving it as it is and no idea (XVIII rank).

Key Words : NRM, Watershed farmers, Knowledge

#### **INTRODUCTION**

The nature and status of natural resources play a pivotal role for sustainable yields in various crops. The potentiality of these resources especially like soil and water is decreasing in alarming propositions, there by effecting farming situation as well as crop production both at micro and macro level. The isolated approach of natural resource management does not yield expected results whereas community based management derives maximum benefits to the farmers in terms of soil, water and moisture conservation for sustainable use of these resources for better crop production. There is every need to gauge the degree of natural resource management behaviour of the farmers for their sustainable use. Keeping this in view, the present investigation on a study on knowledge of watershed farmers on various NRM practices in watershed areas of Andhra Pradesh state was carried out.

### MATERIAL AND METHODS

The state of Andhra Pradesh and the three regions *i.e.* Telangana, Coastal Andhra and Rayalaseema and

from each region one district *i.e.* Mahaboobnagar from Telangana, Prakasham from Coastal Andhra and Anathapur from Rayalaseema were selected purposively. From each district two IWMPs, from each IWMP area one mandal, from each mandal four villages and from each village ten watershed farmers were selected randomly, thus, a total of six (6) IWMPs, six (6) mandals, twenty four (24) villages and two hundred and forty (240) farmers were considered as sample for the study.

Knowledge test developed in the present study can measure the level of knowledge of watershed farmers on various NRM practices as it showed the greater degree of reliability and validity. All the 30 items in the knowledge test read out to the watershed farmers after establishing rapport with them. The watershed farmers were asked to answer the items by themselves. A score of two and one was assigned for correct and wrong answer for each item, respectively and the total number of correct responses given by watershed farmers out of the 30 items was the knowledge score obtained by him or her. Thus, the maximum and minimum possible scores are 60 and 30, whereas the obtained scores were 50 and 35. The watershed farmers were grouped into three categories based on exclusive class interval technique.

#### **RESULTS AND DISCUSSION**

It could be indicated from the Table 1 that majority of the watershed farmers fell under the category of medium (36.25%) level of knowledge followed by low (33.33%) and high (30.42%) level of knowledge. The medium followed by low level of knowledge of watershed farmers might be due to lack of inquisitiveness to understand the logistics of implementation of various NRM activities. Farmers used to practice the agriculture technologies without knowing the rationale on implementation of these practices. This finding is in conformity with those of Doli (2006) and Raju (2002).

The Table 2 indicates the rank wise analysis of level of knowledge of watershed farmers on various NRM

practices infers that the usage of check dams to harvest the water has been perceived as first rank followed by usage of percolation tank for increasing the groundwater (II rank) and knowledge on important natural resources (III rank). The least preferred knowledge items were NRM is possible only by the community participation (XIX rank), the grass which is highly recommended as vegetative barrier (XIX rank), the plants which are highly recommended for live fencing (XVIII rank) and gully formation can be checked by either building check dams or increasing width of gully, leaving it as it is and no idea (XVIII rank).

The harvesting of water through check dams is more visible and thereby the farmers could gauze easily the importance of check dams. It is the same in case of percolation tanks where in the groundwater level recharges effectively which can be easily perceived by the farmers. The farmers could easily identify the important natural resources as they are the pre requisite and continuously use for crop cultivation. The less knowledge on possibility of NRM only through community participation, grass as a vegetative barrier, live fencing and stoppage of gully formation might be due to not having direct influence of these practices on crop cultivation and also not visualizing the impact within a short period of time. The government should take measures to inculcate team spirit in forming the groups among the watershed farmers to follow the community approach. Measures may be taken upto conduct more awareness programme on highlighting the importance of grass species and other plants used as vegetative barriers and live fencing. Skill oriented training programmes may be conducted by the state agriculture universities and KVKs to impart the skill to check the gully formation during the heavy rains.

#### **Conclusion:**

Officials of IWMP should organize more specialized training programmes to improve the knowledge level of the farmers on various NRM activities. New ICT methods should be evolved for quick and easy transfer of technical information among the farmers.

Table 1 : D	( <b>n=240</b> )			
Sr. No.	Category	Class interval	Frequency	Percentage
1.	Low level of knowledge	35-40	80	33.33
2.	Medium level of knowledge	40-45	87	36.25
3.	High level of knowledge	45-50	73	30.42
